

No plants in the center. What now?

Although the paving trend of city centers is increasingly changing in favor of greenery, there are still places where plants are missing. The Old Town Squares, promenades, sidewalks ... Who does not know a place dominated by concrete? However, nothing is lost – there are solutions which allow natural accents also hit such places, and most importantly: they can survive in excellent condition.

All is not lost

Before the greening trend in public spaces takes off for good, and the centers of our cities will permanently cover with lawns, ornamental plants or trees, some time will have to pass. Lack of funds or good will are not always the obstacles. Complicated sewage system, parking lots or pedestrian crossings – all these elements can hide under the surface of city squares. Planting becomes difficult enough to abandon this idea in favor of other solutions.... But they do exist!

Where nature does not reach

Places defined as problematic – meaning without ground or cut

by underground infrastructure, do not have to be difficult to be decorated with flowers. It is enough to focus on plantings in containers. Modern city pots are quite different from those we know from the past. Contrary to the old ones, they are mobile and they delight with a solid workmanship as well as vivid colors and unique form. Just like the **bowl-shaped pot Plane Ring Lux**.

City pots to play with ... space

Contemporary urban space must be ready for many challenges: at

one time it becomes a traditional square with ordinary everyday life, and on the other day it plays the role of the stage and the main backdrop for the harvest festival or city anniversary. For this reason that city pots must be mobile. In this way, new opportunities open up for cities. Not only the option of flowering places without any substrate, but also a chance to modify the composition at any time. **XXL pots**, such as a **bowl-shaped flower container Plane Ring Lux**, give a chance to bring a large number of seedlings into the space. All without damage to the ground, and most importantly, without harming the plants.
